(first entry)

06-MAY-2004

ADJ76888;

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or-2; and/or (i) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region; New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers. Disclosure; SEQ ID NO 54; 164pp; French. cytostatic; antipsoriatic; antibody; (FABR) FABRE MEDICAMENT SA PIERRE. ö
          transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate. Jung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder; immune disorder;

```
Treeperor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting trowner kinase activity of the receptor.

Comprision a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGRF, and/or connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGRF, and/or connected with an overexpression and/or an abnormal contractivation of the transduction pathway of the signal mediated by the interaction of IGF or IGF2 with IGF-IR and/or or EGRF with EGRF, where the administration of the medicament does not induce or only sightly interaction of the transformation of normal cells into cells with tumoral creature, preferably IGF-dependent, especially IGF and/or IGF2.

Consistent intended for preparation of a medicament intended to inhibit the growth and/or the proliferation of tumor cells, preferably IGF-dependent and/or EGF-dependent of medicament intended for prevention or for the treatment of encer is chosen from prostate cancer. (I) is useful in the preparation of a medicament intended for prevention or for the treatment of cancer, where the cancer is chosen from prostate cancer. (I) is useful in the preparation of a medicament intended for the specific targeting of a biologically active compound to the specific targeting of a biologically active compound to cells expressing or overexpressing of illnesses induced by an overexpression or an underexpression of the IGF-IR and/or EGFR receptor. (I) a useful for in vitro diagnosis of illnesses induced be abnormed to be additio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
invention relates to a novel isolated anti-insulin-like growth factor

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or retar diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (IGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Bspecially they inhibit transformation of normal cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis, ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein sequence used to generate the Ab of the invention

The invention relates to a novel isolated anti-insulin-like growth factor.

Treceptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of expeditionally inhibiting try triase activity of the receptor, comprising a light or heavy chain having at least one complementary comprising a light or heavy chain having at least one complementary comprising a light or heavy chain having at least one complementary capable (GR) consisting of one of two fully defined is amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of activation of the IGF-IR and/or EGFR, and/or connected with a hyperactivation of the ransduction pathway of the signal mediated by the interaction of IGF-IR and/or EGFR, and/or of IGFI and/or IGF2—connected with inhibition of the insulin contracter, preferably IGF-dependent, especially IGF1 and/or IGF2—copendent, and/or EGFR-dependent and/or EGFR-dependent and/or HER2/neu-dependent and/or IGF2-dependent and/or EGF-dependent of tumor calls, preferably IGF-and/or IGF2-dependent and/or EGF-dependent and/or EGF-dependent of tumor calls, preferably IGF-and/or IGF2-dependent and/or EGF-dependent calls (I) is useful in the preparation of a medicament intended for the proliferation of a medicament intended for the proliferation of a medicament intended for the prevention or of the preparation of a medicament intended for the prevention or of the preparation of a medicament intended for the prevention o overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample with (1), which is optionally labeled. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fragment comprising one or more complementarity determining regions cides of a defined light CDR and a heavy CDR with at least one amino acid (as) substitution where the antibody has specific binding activity for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, anglogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with anglogenesis, tumour growth and/or cancer metastasis. The present sequence is the partial amino acid sequence of the mouse anticryptic collagen site antibody HU177 variable region light chain used during the creation of the antibody of the invention.

```
The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or creat diseases associated with overexpression and/or abnormal activity of IGF-IR. Ab and its fragments are used to prevent or IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGP-IR) antibody (I) or its functional fragment, being capable of bindding to human IGF-IR and, if necessary, capable of specifically inhibiting tyrosine kinase activity of the receptor. Comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of the preparation of the IGP-IR and/or EGF, and/or connected with a noverexpression and/or an abnormal activation of the IGR-IR and/or EGF, and/or connected with a chyperactivation of the transduction pathway of the signal mediated by the interaction of IGF1 or IGF2 with IGF-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended
                                                                                                                                                                                                                                                                                                                        Insulin-like growth factor 1 receptor; antibody; tumor; cytostatic; neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder; light chain variable region.
antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated anti-insulin-like growth factor I receptor (IGF-IR)

The present invention relates to a humanised form of the antibody 340 (a mouse monoclonal antibody which binds to epidermal growth factor (BGF) receptor and inhibits binding of BGF), obtainable from the cell line deposited with the BCACC under accession number 97021428. The humanised form of the antibody 340 is useful in gene therapy, medicine and in the manufacture of a medicament for treatment or prophylaxis of cancer. The manufacture of a medicament for treatment or prophylaxis of cancer. The invention is useful for treating colorectal, lung, breast, gastric or ovarian cancers or also for preventing the recurrence of cancer after initial treatment or surgery. The invention is also useful for enhancing a protective immune response against cancer by optimised immunisation schedules. The humanised form of the antibody 340 has reduced immunogenicity but shows similar binding to cells expressing EGF receptor, as the original muxine antibody and has increased ability to receptor, as the original muxine antibody and has increased ability to inhibit the growth of EGF receptor expressing cells. The invention is used as cell growth and apoptosis inhibitor. The present sequence is mouse monoclonal antibody alpha 340 light chain variable (VK) region
                                                                                                                                                                                                New humanized form of mouse monoclonal antibody 340 which binds to epidermal growth factor receptor and inhibits binding of growth factor, useful for treating colorectal, lung, breast, gastric and ovarian cancer.

The invention relates to an antibody or its antigen-binding fragment that binds by a precifically and with high affinity to glycosylated and non-binds appecifically and with high affinity to glycosylated and non-colling appecifically and with high affinity to glycosylated and non-colling appecifically and with high affinity to glycosylated and mouse II-13, and neutralizes human II-13 activity at an approximate molar ratio of 1:2 (Wabitili). Also included are an antibody that binds to the same epitope as the antibody of the light and heavy chain variable regions of the novel antibody, a hybridoma cell line that produces a monoclonal antibody cregions derived from 2288/C1, 2288-4, 227-26, and 227-43 and designated with the ArCC deposit number PrA-5657, PRA-5656, PRA-5654, and PRA-5655, crespectively), a cell line comprising the mucleic acid encoding the antibody a vector comprising the mucleic acid encoding the antibody, a composition (comprising the antibody and a physiologically acceptable cartier dilutent, extigient, or stabilizer), a variable light chain comprising an amino acid sequence having the formula: FRIA-CDRIZ-FRIJ-C New antibody or its antigen-binding fragment that binds specifically and with high affinity to glycosylated and non-glycosylated human interleukin-13 (IL-13), useful for treating IL-13-mediated disorders, such as asthma allergic rhinitis, atopic dermatitis, allergic conjunctivitis, eczema, utticaria, food allergies, chronic obstructive pulmonary disease, ulcerative colitis, RSV infection, uveitis, scleroderma, or osteoporosis. The present sequence represents a the light chain variable region of a ä Huang Singh S, Claim 10; SEQ ID NO 7; 129pp; English. mouse anti-IL-13 monoclonal antibody. Yan C, Σ Ξ WPI; 2005-506603/51.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expresses and/or binds interleakin-13 (IL-13). The method comprises administering an anti-IL-13 antibody or its binding fragment that binds deministering an anti-IL-13 antibody or its binding fragment that binds expresses and/or binds interleakin-13 (IL-13). The method comprises administering and non-glycosylated and non-glycosylated and non-glycosylated man in-13, and neutralizes human IL-13 activity at an approximate molar ratio of 1:2 (Mab:IL-13). The method also describes 1) a method for treating Hodghin's disease comprisisng administering a daministering the antibody or binding fragment that comprising administering the antibody, or a binding fragment that chaption in thibiting IL-13 dependent proliferation of neoplastic cells in a mammal comprising administering the antibody or a binding fragment that cinhibits the biological activity of IL-13 and 3) diagnosing a cancer or tumor overexpressing IL-13 comprising the use of the anti-IL-13 antibody to detect overexpression of IL-13 in the biological sample taken from a patient suspected of having the cancer or tumor. The antibodies used in the method of the invention are 228B/C produced by the hybridoma designated PTA-565. The antibody is a human content of method of the hybridoma designated PTA-565. The antibody of a bunding content of enimations. The antibody, a single domain antibody and humanized antibody a single domain antibody will produced by the hybridoma designated cytotoxicity and or comprises a physiologically acceptable carrier, diluent, excipient, or stabilizer. The antibody mediates killing by antibody dependent cell-mediated cytotoxicity and/or complement cell-mediated cytotoxicity and or comprises at least a variable light or heavy chain region. The variable light or heavy chain region. The constant region further comprises a constant region. The constant region is from a region further comprises a constant region. The constant region is from an igg antibody. The antibody further comprises the heavy chain. The constant region is from an igg a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating a neoplasm, e.g. Hodgkin's disease, that expresses and/or binds interleukin-13 (IL-13) comprises administering an anti-IL-13 antibody or its binding fragment that binds to both glycosylated and non-glycosylated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      al antibody enzymes by identification of a catalytic n the stereostructure for production of antibody enzymes therapeutic agents for cancer and infectious diseases
associated with a cytotoxic agent, such as a radioisotope or a chemotherapeutic agent. The methods and antibodies are useful for traating neoplasms such as Hodgkin's lymphoma, skin cancer, stomach cancer, colon cancer, breast cancer, pancreatic cancer, liver cancer, prostate cancer, lung cancer, head-and-neck cancer, renal cell cancer, aguanous cell carrionan, AIDS-associated Kaposi's carcinoma and brain cancer. This sequence represents the humanized mouse monoclonal antibody 227-26 and 227-26 at variable light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DVLMTQIPLSLPVSLGDQASISCRSSQSIVHSNGNTYLQWYLQKPGQSPKLLIYKVSNRL 60

                                                                                                                                                                                                             9
       by the method of the invention has virucide, anti-HIV, cytostatic, and antibacterial activity. The enzyme acts as a helicobacter pylori urease inhibitor, or chemokine receptor CCR-5 (HIV target) antagonist. The method of the invention is useful for the treatment, prevention and diagnosis of cancer and infectious diseases, especially infection by Helicobacter pylori or HIV. The present sequence is used in the exemplification of the invention.

Screening potential antibody enzymes by identification of a catalytic triplet residue in the stereostructure for production of antibody enzymes as diagnostic and therapeutic agents for cancer and infectious diseases including HIV infection.

WPI; 2004-132963/13.

N-PSDB; ADI26491

Claim 39; SEQ ID NO 26; 232pp; Japanese.

The invention relates to a novel method for producing antibody enzymes comprising a structural analysis step which confirms the existence in the predicted stereostructure of the antibody based on its amino acid sequence of a catalytic triplet residue structure in which a serine residue, an aspartic acid residue, and a histidine or glutamic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recognition molecules, e.g. antibodies (and nucleic acids) that bind specifically to Core-1 antigens, useful for diagnosis, treatment and prevention of tumors and metastases.
                                                                                                                                                                                                                                                                                                                             9
residue are located sterically close to one another. An enzyme produced by the method of the invention has virucide, anti-HIV, cytostatic, and antibacterial activity. The enzyme acts as a helicobacter pylori urease inhibitor, or chemokine receptor CCR-5 (HIV target) antagonist. The method of the invention is useful for the treatment, prevention and diagnosis of cancer and infectious diseases, especially infection by Helicobacter pylori or HIV. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antibody; Core-1 antigen; framework region; immunoglobulin superfamily; protease inhibitor; lectin; helix-bundle protein; lipocalin; variable heavy chain; VI; varcine; diagnosis; alleviation; treatment; tumour; breast; colon; stomach; pancreas; large/small intestine; ovary; cervix; lung; prostate; kidney; liver;

lysine-rich region and/or a multimerisation domain, most particularly it is a single-chain antibody fragment, multibody, Fab fragment, fusion protein of an antibody fragment with peptide or protein, and/or an ig of types G, M, A, E or D and/or their subclasses. It may be human, additional sequences/structures in the constructs are ig domains of additional sequences/structures in the constructs are ig domains of various species, interacting or stabilising domains, signal sequences, tluorescent dyes, toxins, antibodies with catalytic activity or other specificities, cytolytic agents, enzymes, immuno-modulators or effectors, MHC molecules, antigens, chelators for radioactive labels, liposomes, transmembrane domains, viruses and/or cells, specifically, catoring and/or lated vectors and host cells, are useful for prevention (e.g. as vaccine), diagnosis, alleviation, treatment, colon, stomach, pancreas, large/small intestine, overy, carvix, lung, colon, stomach, pancreas, large/small intestine, overy, cervix, lung, prostate, kidney and/or liver) and/or metastases (particularly to liver), the invention provide simple, reliable and efficient detection of tumours. They are specific for carcinoma and show almost no binding to healthy tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The antibodies of the invention are useful for treating and preventing the development of infections caused by the respiratory syncytial virus (RSV). The present sequence represents the chimeric IC2 kappa light chain carried by plasmid p533. IC2 is a murine monoclonal antibody known to bind to the RSV G glycoprotein. The above

J. Glin. Invest. 52:1276-1281(1973)
-!- MISCELLANEOUS: The anajor amyloid protein appears to be identical
with the Bence Jones protein isolated from the same patient.
-!- MISCELLANEOUS: This protein was isolated from the urine of a
patient with plasma cell dyscrasia and amyloidosis.
-!- MISCELLANEOUS: The C region of this chain has the INV (1,2)
                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=74148480; PubMed=4596149;

"Variable region sequence of the light chain from a Waldenstroms IgM
with specificity for phosphorylcholine.";
Biochemistry 15:3829-3833(1976).
-I- MISCELLANEOUS: This chain was isolated from a Waldenstrom's
macroglobulin that binds phosphorylcholine.
                                                                                                                                                                                                                                                                                                61 YGVPDRFSGSGSGTDFTLKISSVBAEDLGVYYCFQGSHVPWTFGGGTKLEIK 112
